General to Flange and Fittings

Introduction

According to DIN 28400, the term "Ultra-high Vacuum (UHV)" designates the pressure range below 10^{-7} mbar.

Several physical quantities, such as mean free path, monolayer time, flow density of the particles impinging on the walls, leak rate and the degassing rate are of significance in the characterization of this pressure range. For the definitions of these quantities refer to technical publications on this subject.

In order to attain or maintain pressures below 10^{-7} mbar, the following pre-conditions must be met:

- The vapor pressure of the pump fluid or lubricant should be in accordance with the desired ultimate pressure
- the leak and degassing rates of the entire apparatus including its installations must be extremely low.

Generally, both leak rate and back-streaming effects through the pump can be kept at sufficiently low levels by using suitable UHV sealing materials and pumps.

However, a sufficiently low outgassing rate can only be achieved by baking out the entire apparatus at temperatures of about 300 °C (572 °F) for a longer period of time. It is only under these conditions that the mono-layers of atoms or molecules, which attach quite firmly to the surfaces of the vacuum apparatus including its installations, are desorbed.

Consequently, components for UHV systems are generally made of stainless steel. Metal gaskets, ceramic feedthroughs and bakeable observation windows are used exclusively.

For applications in the extreme UHV range (XHV) the outgassing rate of the CF flanges and the UHV components can be reduced by about two orders of magnitude by a special degassing process.

The high standard of development and manufacture combined with the use of high quality materials guarantee that UHV components from Oerlikon Leybold Vacuum are able to meet even the most demanding requirements.

Advantages to the User

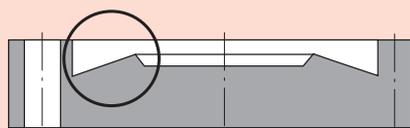

- Stabilized Oerlikon Leybold Vacuum knife-edge
- High reliability
- Special knife edge profiles ensure the highest degree of leak tightness
- Flange connection can be baked out up to 450 °C (842 °F)
- Easy to assemble, helium-tight
- Symmetrical flange connection
- Equal sealing profiles
- Small outside diameter with respect to the nominal width
- Can be joined by welding or brazing using any desired process, also with other nickel chromium steel grades
- For use either with a flat gasket made of OFHC copper (oxygen-free) or FPM (FKM) O-ring
- Self-centering
- Fixed and rotary flanges in almost any size

These Arguments Prove Oerlikon Leybold Vacuum's QUALITY

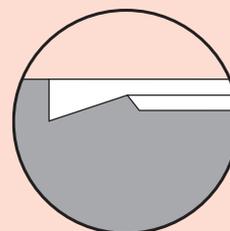

- Availability of all components at short notice
- Worldwide advice at any time to answer your questions relating to vacuum systems
- Utilization of most advanced manufacturing methods
- Environment-friendly cleaning baths with complete waste disposal and recycling facilities
- Environment-friendly and secure packaging
- Total Quality Management methods during all processing stages
- Controlled material quality
- Compatible to your existing flanges of the same system
- Highly leak-tight down to leak rates of 1×10^{-9} mbar \times l \times s $^{-1}$; all components are subjected to a helium leak test
- Low outgassing rates of the materials through
- choice of the right material quality, especially for vacuum apparatus
- excellent cleaning methods
- Documentation available for all components

- The well-proven Oerlikon Leybold Vacuum geometry for the cutting edges

The stabilized Oerlikon Leybold Vacuum profile for the cutting edges

Diagrammatic view

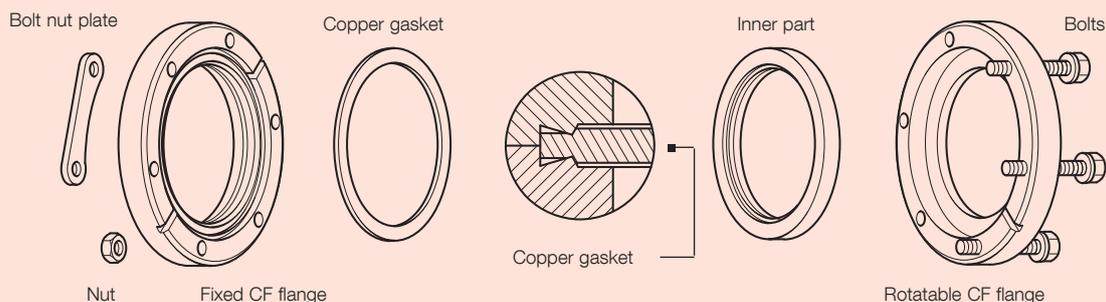

Partial view

- Forged steel materials of high tensile strength and density
- Material quality for standard applications DIN 1.4301 corresponds to AISI 304
- Tightly checked, **close dimensional tolerances** for the entire sealing geometry
- **Low degassing rates** of the tube material used

Advantages

Reliable sealing of UHV connections
over hundreds of
heating cycles

General

Vacuum systems (i.e. systems for pressures ranging from 2.5 bar to 10^{-9} mbar (1.9×10^{-3} Torr to 0.75×10^{-9} Torr)) are quickly and easily assembled owing to the modular construction principle which is based on interchangeable standard components by means of vacuum-tight, demountable flange connections. Individual components may be exchanged easily at any time. Depending on the intended use and size of the connection, flanges of different types have been developed. The ISO-KF flange connection was developed by Oerlikon Leybold Vacuum many years ago and has been widely accepted by all users of vacuum equipment. This catalog part lists all flange connections and fittings including adaptors for ultra-high vacuum components.

Components marked with [< 1000 mbar (< 750 Torr)] are not allowed for use at pressures exceeding 1000 mbar abs.

The components and flange connections are intended for use in connection with vacuum systems. They have not been designed to support mechanical loads. All loads must be supported separately at the connection components.

Flange Designations

The designations used by Oerlikon Leybold Vacuum for clamp flanges, fixed flanges (bolted) and collar flanges with retaining rings correspond both to the international standards ¹⁾ and to the usual nomenclature in vacuum technology.

¹⁾ The nominal width DN corresponds only approximately to the inner diameter, i.e. is not necessarily identical to the inner diameter. Differences in the actual inner diameter are quite normal in practice and do not contravene standards.

Flanges and Fittings

Flange Connections

ISO-KF Connection

The ISO-KF connection (to DIN 28 403 and ISO 2861) permits rapid fitting and replacement of components in vacuum systems. It consists of two symmetrical ISO-KF flanges **(1)**, a centering ring with O-ring gasket **(2)** and a clamping ring **(3)**. High vacuum tight ISO-KF connections can be made without the use of tools simply by turning the wing nut of the clamping ring.

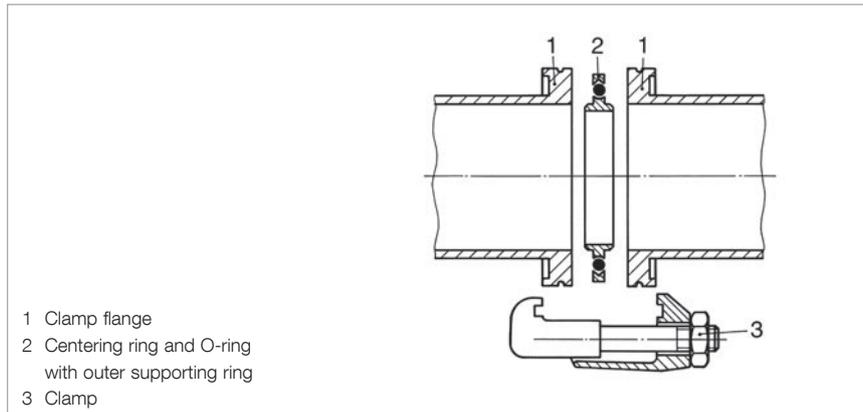

ISO-KF flange connection

ISO-K Clamp Flange Connection

The clamp flange connection (to DIN 28 404 and ISO 1609) allows components from DN 63 to DN 630 to be connected in any position regardless of the bolt hole arrangement on any fixed flanges.

It consists of two clamp flange components **(1)**, a centering ring **(2)** with an outer ring enclosing the O-ring gasket, and several clamps **(3)** which the connection is assembled and tightened with. Since the centering ring can be firmly inserted into the centering groove of the flange, even horizontal connections are quickly and easily fitted.

ISO-K clamp flange connection

ISO-F / DIN Fixed Bolted Flange Fittings

With the appropriate collar flanges, the clamp flange can be connected to various fixed bolted flange systems (ISO-F, DIN EN 1092-1, etc.) see figures in chapter "ISO-F and DIN EN 1092-1 Fixed Flange Fittings".

CF Flanges and Components

The CF flange connection consists of two geometrically identical flanges with a flat gasket made of OFHC copper, bolts and nuts and washers.

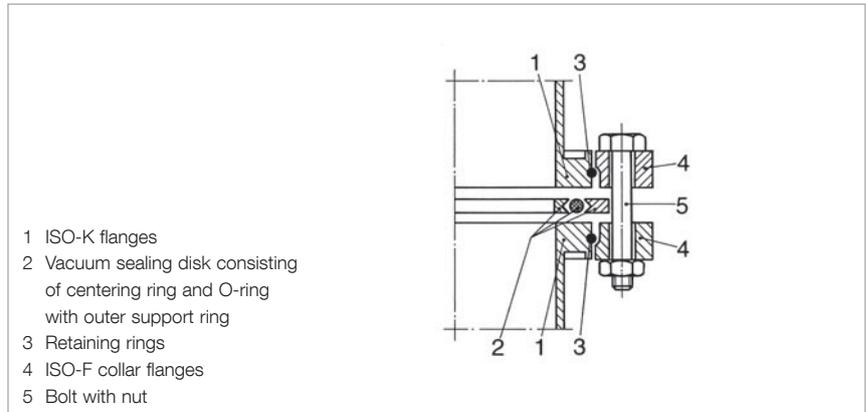

CF components are made of selected, corrosion resistant types of stainless steel.

All components are inside welded to prevent right from the beginning any cracks or pocket holes which might constitute a so-called virtual leak.

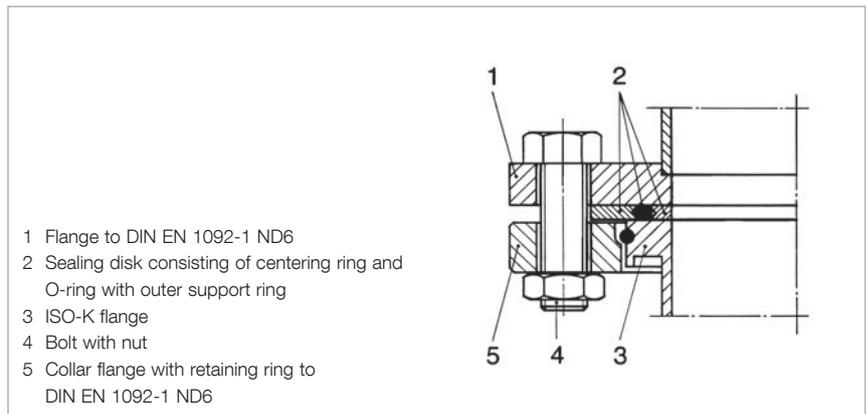

Bake Out Temperatures for the Gaskets

CR and FPM (FKM) gaskets can be inserted in all listed flange types, while aluminium gaskets may be used for higher vacuum requirements.

CR gaskets can be used in the temperature range from -40 °C to +100 °C [-40 °F to +212 °F] (max. bakeout temperature), FPM (FKM) gaskets from -15 °C to +150 °C [+5 °F to +302 °F] (max. bakeout temperature). Aluminium gaskets from -196 °C to +200 °C [-321 °F to +392 °F] (max. bakeout temperature gradient; ΔT max. 2.5 °/min).

Clamped flange connection with collar flanges

Connection between a DIN EN 1092-1 ND 6 flange and an ISO-K flange with DIN EN 1092-1 collar flange

ISO-KF Flange Fittings and Components

DN 16 ISO-KF to DN 50 ISO-KF Aluminium Design (to DIN 28 403) [Tubes similar DIN 28 403]

The small flange connection developed by Oerlikon Leybold Vacuum has become the basis of the international standard for vacuum technology.

Advantages to the User (Aluminium and Stainless Steel)

- Quick, safe and reliable
- No tools are need to provide a vacuum-tight seal
- Suitable down to pressures of 10^{-7} mbar (0.75×10^{-7} Torr)
- Easy to disassemble and clean
- In the case of special requirements as to degassing for the purpose of reducing the outgassing rate and in case of special requirements as to corrosion resistance, we recommend the use of stainless steel components.

Additional Benefits of the Stainless Steel Types

- Can be baked out up to 200 °C (392 °F) when using metal seals
- Can be degassed up to 150 °C (302 °F) with FPM (FKM) gaskets
- With metal seals suitable for pressures down to 10^{-9} mbar (0.75×10^{-9} Torr)
- Corrosion resistant
- Low degassing rate
- For standard applications involving pressures up to 2.5 bar (1.9×10^3 Torr) abs. even with outside ring resp. ultra sealing ring and 3-part clamping ring 5 bar
- Can be degassed up to 200 °C (392 °F) with UHV aluminium rings or disks

Flexible Compensation Elements

Vacuum systems and pump systems often require components which are capable of protecting sensitive instruments against impacts or excessive vibrations while linking tubes at the same time.

Advantages to the User

- Easy and quick to install
- Safe and reliable
- Tubes may be turned in any direction
- No centering and sealing ring required
- Capable of withstanding temperatures up to 80 °C (176 °F)
- Suitable for pressures down to 10^{-5} mbar (0.75×10^{-5} Torr)

Quick Clamping Ring

Advantages to the User

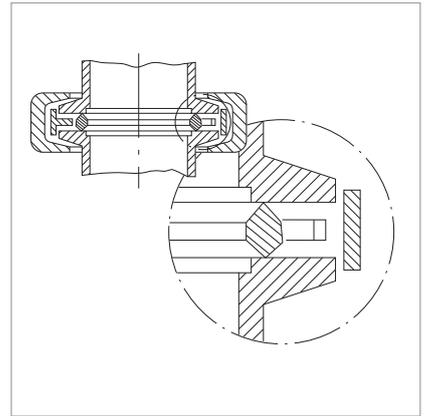

- Quick and effective fitting and disassembly
- Can be fitted with one hand
- Closing action via lever with clamping spring
- Corrosion resistant

ISO-K Clamp Flange Fittings and Components

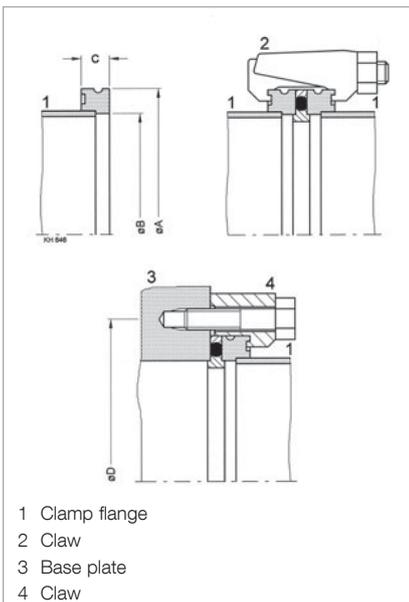

Attaching a clamp flange component and fitting of the clamp

Tightening the clamping bolt

ISO-K clamp flange connection

Flange Components DN 63 to DN 630 ISO-K (to DIN 28 404 in line with ISO 1609/3669)

The clamp flange connection was introduced to the vacuum industry by Oerlikon Leybold Vacuum. Since the fitting of clamp flanges does not depend on any bolt holes in the flange, these components may be installed in any orientation.

Advantages to the User

- Quick to fit
- Safe and reliable
- Can be turned in any direction
- Easy to disassemble, thus easy to clean
- Suitable for pressures down to 10^{-7} mbar (0.75×10^{-7} Torr) when using O-rings and down to 10^{-9} mbar (0.75×10^{-9} Torr) when using metal gaskets
- Easily adaptable to other flange systems
- Mounted by means of clamps (ISO-K) or collar flange with retaining ring (ISO-F, DIN EN 1092-1)
- Clamp flange components are used with CR or FPM (FKM) gaskets or with ultra sealing disks made of aluminium

- Degassing temperatures for CR, max. 100 °C (212 °F)
- for FPM (FKM), max. 150 °C (302 °F)
- for the ultra sealing disk, max. 200 °C (392 °F)

The pressure range for the application depends in each case on the sealing method which is used and is thus limited for ultra sealing disks to 10^{-9} mbar (0.75×10^{-9} Torr), for FPM (FKM) gaskets to 10^{-8} mbar (0.75×10^{-8} Torr) and for CR sealed components to 10^{-7} mbar (0.75×10^{-7} Torr).

Flexible Compensation Elements (CR)

Vacuum systems and pump systems often require components which are capable of protecting sensitive instruments against impacts or excessive vibrations while linking tubes at the same time.

Advantages to the User

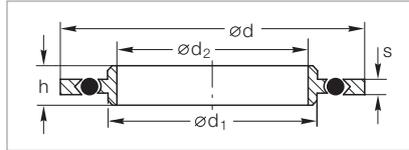

- Easy and quick to install
- Safe and reliable
- Tubes may be turned in any direction
- No centering ring and sealing ring is needed since the seal is provided by the smooth tube surface
- Capable of withstanding temperatures up to 100 °C (212 °F)
- Suitable for pressures down to 10^{-5} mbar (0.75×10^{-5} Torr)

ISO-F and DIN EN 1092-1 Fixed Flange Fittings, ND 6

Note: ND 6 states a dimension and not refer to an operating pressure of 6 bar!

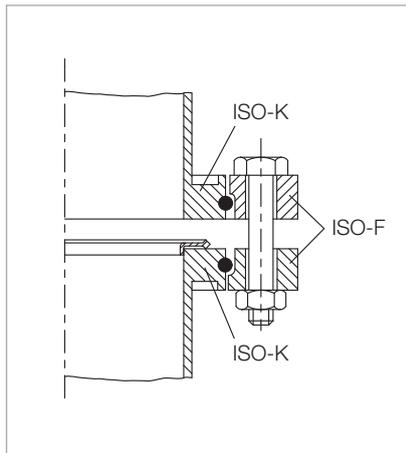

Mating clamp flanges with tubulation using collar rings and sealing disk

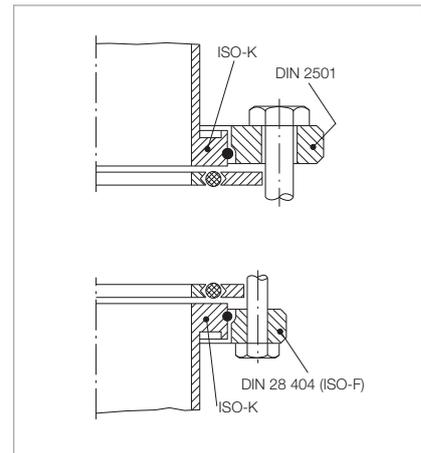

In addition to clamp flange connections, fixed welded flanges (ISO-F or to DIN EN 1092-1) are used in the area of vacuum engineering to interconnect valves, pumps and other components.

Advantages to the User

- A high vacuum seal is maintained also at large nominal width and high mechanical loads
- Evenly distributed sealing force through a large number of bolts
- Can be easily adapted to other flange systems
- Vacuum sealing disks consist of a CR O-ring seal with inner and outer aluminium ring
- Fixed flanges and collar flanges may also be constructed as all-metal seals by using ultra sealing disks

Mating clamp flanges using bolted collar rings and ultra sealing disk

Comparison: Clamp flange with collar flange to DIN EN 1092-1 and clamp flange with collar flange to DIN 28 404; ISO-F

CF Flange Fittings and Components

CF Flanges

The CF flange connection consists of two identical flanges with a flat gasket made of **OFHC copper**, bolts, nuts and washers.

Dimensional drawing for CF flanges

Sealing Principle

When assembling the CF flange connection, the flat copper gasket fits with a slight clearance into the outer recess of the flanges and thus assures good centering of the flange connection. If the flange bolts are properly tightened according to the instructions, the knife edge of the flanges penetrates into the flat copper gasket, whereby the shear action of the outer face of the cutting edge – as seen from the flange axis – produces a yield pressure on the copper gasket, while the inner face of the edge produces a cutting action.

During this process the copper gasket adapts it-self optimally to the micro-structure of the outer knife edge. This explains the high sealing effect and the especially low leak rates of CF flange connections. A radial groove extending right up to the sealing ring is provided for leak testing of the flange connection. In order to ensure that the sealing knife edge is not damaged during frequent use of the flanges, the conventional geometry of such knife edges for CF flanges has been developed further. By using the Oerlikon Leybold Vacuum developed obtuse angled knife edge

profile the strength of the sealing knife edges has been significantly stabilized. In addition to the actual knife edge, the flanges are provided with a concentric sealing surface for placement of a FPM (FKM) gasket or a supporting ring with FPM O-ring, which may be baked up to 150 °C (302 °F) (does not apply to observation windows).

This design has the advantage, that it is possible to equip the apparatus with elastomer gaskets prior to final assembly, so that the system can be tested under normal high vacuum conditions.

Conversion Factors

- Magnetizing field H, unit:
Previously used unit: Oersted (Oe) $A \times m^{-1}$
1 Oe = 79.577 ($A \times m^{-1}$)
- Strength of the magnetic field B, unit:
Previously used unit: Gauß (G) $Vs \times m^{-2} = \text{Tesla (T)}$
1 G = $10^{-4} Vs \times m^{-2} = 10^{-4} T$

Important: In the table of Chapter "General" the German designation for the type of steel is also stated in accordance with AISI.

CF Components

CF components are manufactured according to the requirements outlined in the introductory chapter. They are made from selected and corrosion resistant types of stainless steel. Both design and production methods are such, that the components meet the requirements of UHV applications. All components are fusion welded from the inside to prevent fissures and pocket holes (virtual leaks which cannot be located by leak detection methods from the outside). If welding from the outside cannot be avoided due to design constraints, the welding seam penetrates to the inner side, the side of the vacuum.

A carefully implemented cleaning process and suitable packaging for the components are essential prerequisites for obtaining pressures in the UHV range within reasonably short pump down times after assembly (providing the remainder of the apparatus is clean too).

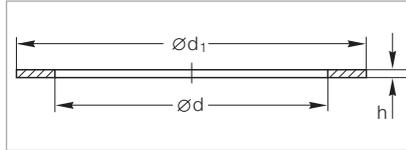

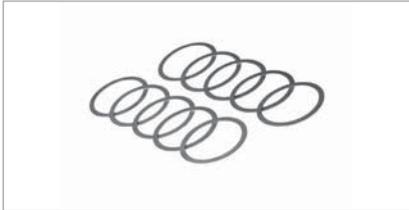

For applications in the extreme UHV range (XHV) the outgassing rate of the CF flanges and the UHV components can be reduced by about two orders of magnitude by a special degassing process.

Advantages to the User

- Low degassing rates
- High degassing temperature
- Leak rates below $1 \times 10^{-11} \text{ mbar} \times \text{l} \times \text{s}^{-1}$
- Basic dimensions correspond to those of the components from other international manufacturers
- Bolts may be inserted from the side of the body

Important: In the table of Chapter "General" the German designation for the type of steel is also stated in accordance with AISI.

Observation Windows for Vacuum Systems

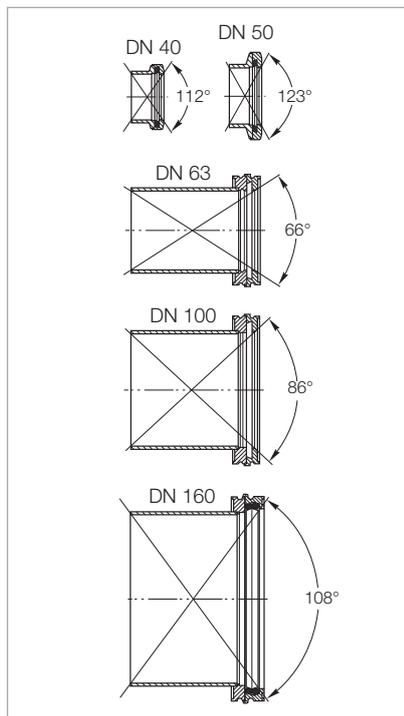

Observation of the phenomena in the vacuum chamber is very important for many vacuum processes. Measurements and monitoring can often be accomplished only by means of external instruments used under normal atmospheric pressure conditions.

This calls for highly transparent, rugged observation windows featuring a wide angle view.

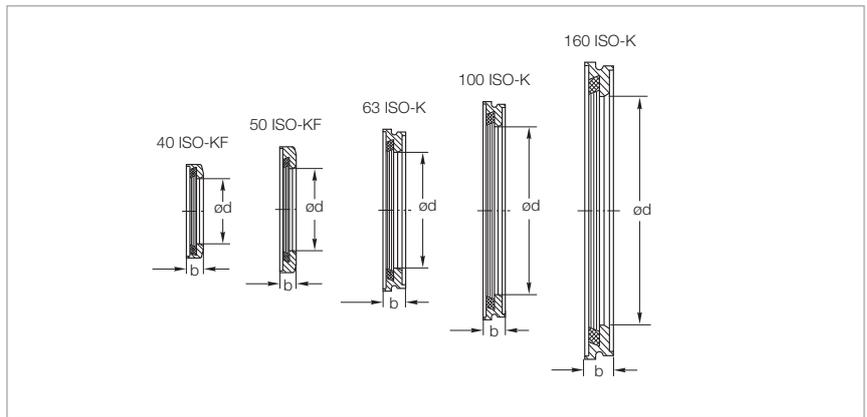

Advantages to the User

- Flat design
- Easy to fit and remove
- Easy to clean
- Wide viewing angle
- Can be baked out up to 150 °C (302 °F)
- May be combined with ISO-KF and ISO-K components
- No special mounting components are required
- The FPM (FKM) O-ring seals against the atmosphere (integrated centering ring)
- Each observation window is subjected to a leak test (thereby ensuring safe operation!)

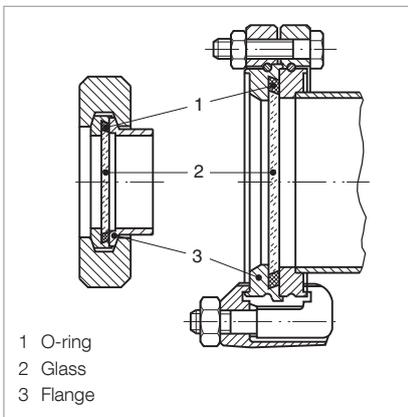

Viewing angle into vacuum chamber through observation window DN 40 ISO-KF - DN 160 ISO-K (mounting on matching flanges with tubulation)

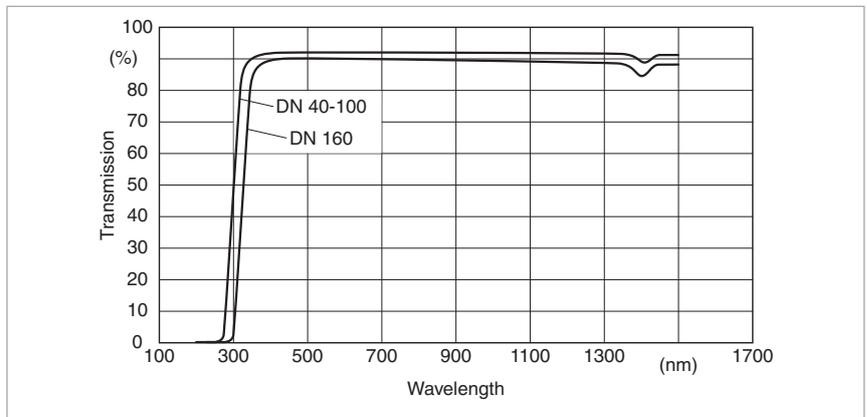

ISO-KF/ISO-K Observation Windows

Window dimensions for the observation windows

ISO-KF and ISO-K observation windows, fully installed

Transmittance as a function of the wavelength for Oerlikon Leybold Vacuum viewports DN 40 ISO-KF to DN 160 ISO-K for different window thicknesses

CF Observation Windows

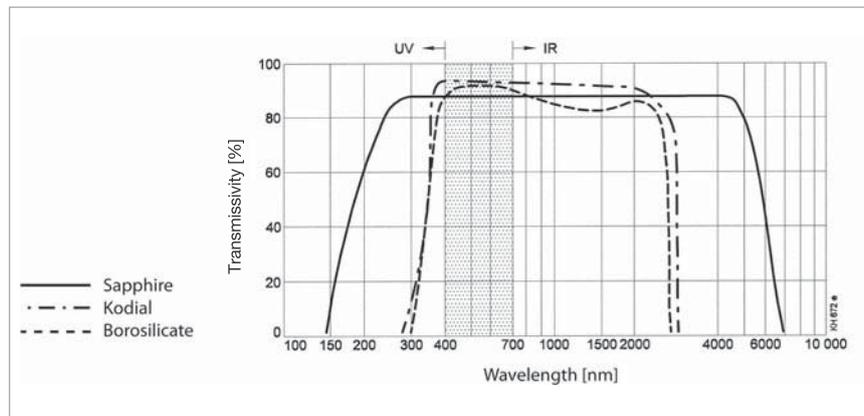

Standard glass is normally only used for visual observations, for photography of experiment details and, among other things, for pyrometer measurements.

Advantages to the User

- Optically plane-parallel glass surface up to just before the edge
- Flange with a wide viewing angle

Dimensional drawing for CF observation windows

Optical transmissivity for the CF observation windows

CF Sapphire Observation Windows

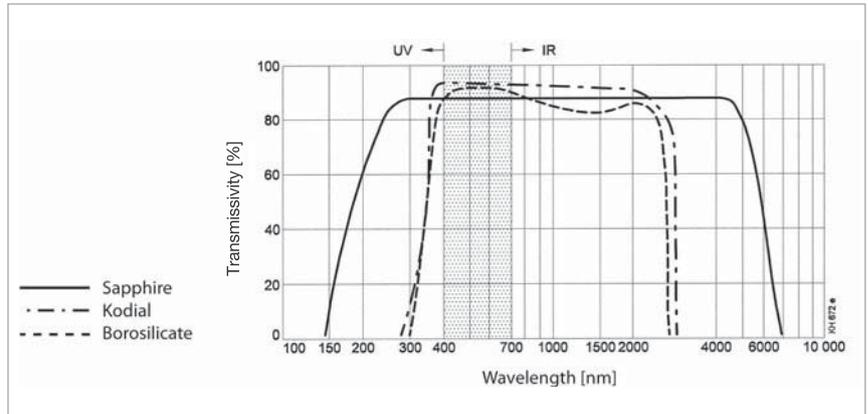

Sapphire exhibits a transmissivity range of 250 nm to 5500 nm. The infrared limit is shifted far in to the infrared range. For this reason, glass of this type is used in connection with sun simulation tests, Laser experiments, high-temperature plasma measurements and spectroscopic measurements, for example.

Advantages to the User

- Optically plane-parallel glass surface up to just before the edge

Dimensional drawing for the CF sapphire observation windows

Optical transmissivity for the CF Sapphire observation windows
